

Topic/Title:

Heading tag || Paragraph Tag || Self Closing Tag ||

Keywords/Questions:

Notes: `<h1> Hello </h1>` = Here h1 is tag and the hello with tag is the element
h1 to h6 is valid no such h7,h8 like this not valid. h1 is biggest and h6 is smallest.
Use MDN to get all the details about "Heading Tag".
A paragraph always starts on a new line, and is usually a block of text.
A paragraph always starts on a new line, and browsers automatically add some white space (a margin) before and after a paragraph.
h1 and p1 are elements because here we can write context. `<hr />` is a void element.
`<hr />` make a line horizontally like that `
` will break a line.

Summary:

So, in this section, we have learnt the basic of HTML like paragraph tags, heading tags and the void element so the `<p>` tag for paragraph, `<h>` for heading and `
` `<hr />` are void element where br for break and hr for horizontal line.

We have done a project also which you will find above where you can practice all these.
